

### *Invest in our Planet*

Planet Earth is the 3rd planet in the solar system. This planet is the homeland of humanity and millions of animal and plant species. Planet Earth is sometimes called the blue planet. It is our house, and we are obliged to take care of that house, to keep it clean, not to greedily use all the opportunities it gives and not to turn it into an ash heap. This means that its ecology must be preserved. Ecology affects all life, from tiny bacteria to processes that span the entire planet Earth. Each of us, understanding the importance of ecology, should protect our planet.

Year by year, the influence of man on nature increases, correspondingly, the responsibility in the protection of living nature also increases. Communicating with nature should be reasonable and deeply cultivated. Careless attitude towards nature, basic use of its resources - every cut branch, desertification of green areas, littering leave serious consequences and often lead to irreparable disasters. The organization of sabbaticals and tree plantings is done in order to eliminate the above-mentioned shortcomings.

Today, every citizen, and first of all, students, must realize the great importance of ecology, which is necessary for the effective use and improvement of nature. But ecology is more than the cleanliness of the environment, it is not separate from man, living organisms, including man, natural resources form ecosystems that support life and vital processes, regulate climate, soil formation, and water purity.

A caring and thoughtful attitude towards nature is like a warm relationship with a friend. One cannot gently caress his right hand and at the same time cut off his left with an ax. One cannot love birds and hate predators at the same time. It is not possible to save water and expose the mountains at the same time. you cannot restore the forest and exhaust the cultivated land at the same time. The country is a single organism.
